HealthCare Rocket

As fast as a rocket. Without the complexity.

THE PROBLEM

Two safe answers can reveal a secret.

Women 45–74 with breast cancer: Austria 72, without Burgenland 71 → one identifiable woman. Both pass the “<10” rule.

Researchers also face JSON, code systems and slow processes.

WHAT WE BUILT

Ask in plain language → rule-based interpretation (ICD-10 · ATC · LOINC) → EHDS decision (Art. 53/54 first) → deterministic statistics → small-cell rule → disclosure ledger that withholds differencing results → decision with reasons.

No AI model touches patient data; nothing leaves the machine.

MEASURED

Decisions 10 of 10 · Numbers 6 of 6 · Privacy leaks 0 · Consistency 10 of 10 · Slowest answer 0.25 s · 208 automated tests pass

Working: everything above, on synthetic data. Simulated: HDAB decisions, SPE. Future: AI adapters, OMOP/FHIR, pilot with access bodies.

Synthetic data only · decisions are a demonstration, not legally binding · github.com/fruityquarrel8v/TRACK-3-ehds
